Abstract

This article shows the important tags in an *article* class. Article contains sections, subsections, and paragraphs as the main content classifications.

1 Introduction

Hello World!

In latex text file number of a spaces between words do not count. New lines in a paragraph also does not count. This whole section will be treated as a paragraph.

What distinguishes one paragraph from another is a blank line. Like there is a blank line here.

An important tip is to avoid trying obtain explicit spaces in the compiled document, like spaces, indents, blank lines (in the final document not in the plain text file). There are ways to do this, but that is the job of the editor, who provides the class file, *not the job of the content provider* which is you.

2 Document Dividers

The article document can be divided into several sections and subsections. The sections can be numbered or not numbered.

2.1 First subsection

There is nothing in this subsection

2.2 Second subsection

Subsections can have upto two subsubs like subsection, and subsubsection.

2.2.1 This is under subsect

Emphasize depends on the environment it is in. Normally it is *italics*, but *if the environment is in italics then it is in* Roman. *Like in this case.*

2.2.2 This is under subsect

More about divisions here

Titled Paragraph By default all the numbers for the sections will be displayed. The fourth level of document division is called as a paragraph. Just as each section has a title a paragraph can also have a title.
