April 2015

Abstract

This document contains essential templates required to write technical reports using \LaTeX . Particularly it shows how to create an equation, figure, table, and bibliographic citation in a \LaTeX document.

Contents

1	Introduction	1
1.1	First section of this chapter	2
1.1.1	Equations and Math symbols	2
1.1.2	Commonly used Symbols	2
2	Literature Survey	3
3	Materials and Methods	5
3.1	Including Figures	5
4	Results and Discussion	7
4.1	Including Tables	7

List of Tables

4.1	Physical properties of the materials used.	7
-----	--	---

List of Figures

3.1 Process flow sheet	5
----------------------------------	---

Chapter 1

Introduction

This document contains commonly used essential templates to write a \LaTeX document. This document is to be used along with the files and folders provided. Writing a \LaTeX document is very simple. Often students need only very simple constructs. This document shows certain essential features that almost all technical report writing requires. Please consult the PDF file for the output of the document, and then look at the corresponding \LaTeX file to reproduce it. The document illustrates the following constructs

- Unnumbered and Numbered Lists
- Equations
- Defining short macros for frequently used symbols
- Bibliography
- Figures
- Tables

The normal procedure for compiling a \LaTeX document that contains bibliographic entries is to follow the following steps

1. `pdflatex mainrep`
2. `bibtex mainrep`
3. `pdflatex mainrep`

4. pdf_{flatex} mainrep

In the above example mainrep is the main L^AT_EX file.

1.1 First section of this chapter

This is the first chapter, which resides in a directory (folder) intro. Each chapter can contain section, subsection and so on.

1.1.1 Equations and Math symbols

Equations should be set in a separate mode. For details on getting various types of aligned equations, consult the $\mathcal{A}\mathcal{M}\mathcal{S}$ -L^AT_EX documentation `amsldoc.pdf`. Simple equations are set as

$$\int dx \cos x = \sin x \quad (1.1)$$

Equation (1.1) is the integral of the cosine function. Mathematical symbols must always be put inside `$$`, when they appear outside a math environment (such as `equation`, `align`, `gather`, etc). The symbol “ex” must be written as x and not as `x`.

Another commonly used construct for equations is the `align` environment to align several equations along a vertical line. It is usually the `=` sign across which the alignment is done. The point of alignment for each equation is specified using the ampersand symbol

$$a = b \quad (1.2)$$

$$a + e + f + g = m + n + z \quad (1.3)$$

$$x + 2 = x^3 + 3x^2 + 2x + 5 \quad (1.4)$$

1.1.2 Commonly used Symbols

For mathematical symbols it is very convenient to define frequently used symbols as a short macro. For example if you are to be using the symbol η_s frequently it is convenient to define it in as:

```
\newcommand{\etas}{\ensuremath{\eta_{\mathrm{s}}}}
```

in the preamble and to simply refer it to in the text as η_s or in a mathematical equation as $\eta_s = \eta(1 + \phi)$.

Chapter 2

Literature Survey

The bibliographic entries are to be kept in a file named `<something>.bib`. In this sample report we call it as `mylit.bib`. This file must be included without the `.bib` extension in the main file as: `\bibliography{mylit}`. Open the file `mylit.bib` to see the format in which the entries are written. This is written in the BibTeXformat. Most of the bibliographic web pages (Scopus, ISI Web) and software (EndNote, etc) allow you to export bibliographic entries in the BibTeXformat.

Citations are referred in the text using `\citet` command which produces citations as though they are part of the text. In order to say somebody did this work as a part of a line use: `\citet{Batzri1973}` have done extensive work on This will produce

Batzri and Korn (1973) have done extensive work on ...

Alternately citations can appear in parenthesis. The command `\citep{Batzri1973}` is used to automatically put the citations in parenthesis. As an example consider the extensive work done in the area of book writing (Sackmann, 1995; Boal, 2012).

Conferences (Richman and Martin, 1992) or collection of work (Sackmann, 1995) also have special entries.

It is also possible to cite thesis like this: Jariwala (2000); Luding (1994) or just unpublished work from Sunthar (2003). Some times there are unclassified bibliographic entries which can be put under “misc” (Smith, 1999).

Chapter 3

Materials and Methods

3.1 Including Figures

Figures are conveniently included using postscript format. If you are generating a figure in a software, please check if the software supports writing to a postscript or a PDF format. This format is loss less vector format and with reproduce in any magnification without any pixelation. Make sure to write it to an “Encapsulated Post-script” or .eps format.

Figures should be given a label and which can be used to refer to them in the running text using `\ref{}` command. Figure 3.1 describes the process flow sheet of the experimental set up used in this report. The Figure 3.1 can also be referred by a short form notation a pre-defined macro `\Figref`.

Figure 3.1: Process flow sheet of the experimental setup. The caption of the figure goes here. A shorter caption can be written in square brackets to identify it in the list of figures.

Chapter 4

Results and Discussion

4.1 Including Tables

Tables are to be used in a special environment so that they have a Number, caption and appear in the list of tables. Table 4.1 is a sample table. In the case of tables, it is a convention to write the caption above the table. Note that in the case of figures the caption appears below the figure.

Table 4.1: Physical properties of the materials used.

Property	Value
Particle Density, ρ_p	2500 kg/m ³
Viscosity, η_s	1×10^{-3} Pa-s
